

USING COMPOST TOILET

Urinating

- Everyone **MUST SIT** when using the compost toilet (including men or you can use nature).
- THIS IS SO IMPORTANT.** Please do not urinate or put any liquids in the back section of the toilet. It will ruin the compost, leak disgusting fluid out the sides of the container and make it smell bad!
- Keeping the back hatch closed when urinating will help divert liquids to the front two holes (might have to sit towards front to have urine direct into the two front holes- it does get wobbly)
- Urine toilet paper goes in the trash can. **NOT** in the two front holes. **NOT** in back bowel area.

Bowel Movement

- To have bowel movement open the back hatch with the lever on the top left side (as you sit).
- Bowel movement toilet paper goes in the back of the hatch with compost and bowel.
- After bowel movement, close the hatch and turn the 3 prong handle (on the lower left) 4-5 times to mix the compost. Please turn prongs to mix or it will smell.

OTHER SUPER IMPORTANT INFO

- AFTER EVERY USE** of the compost toilet **PLEASE** spray a few squirts of the (vinegar and water) solution.
- Tampons should **NOT** be placed in the solid hatch. Many brands are made from a mix of rayon and are chlorine-bleached. These will not decompose - please put them in the trash can.
- To allow for proper ventilation the bowel hatch and the toilet lid should always remain **CLOSED** when not in use. Otherwise it may start to smell.
- ALWAYS** keep the hose attached or smells will blow into the house rather than outside.
- If used properly as described above there will never be any bothersome smells or liquids.
- In the case of getting nauseous and needing to vomit please use a trash can and dispose of the bag. Do **NOT** throw up in the toilet. We can always provide another trash bag.

THANK YOU for helping save fresh water! 1.28 gallons of fresh water is used every time you flush with an energy star toilet.
